2.10 Flow Method

```
Maximize c^T x subject to Ax ≤ b, x ≥ 0;
with the corresponding symmetric dual problem,
Minimize b^T y subject to A^T y ≥ c, y ≥ 0.

Maximize c^T x subject to Ax ≤ b;
with the corresponding asymmetric dual problem,
Minimize b^T y subject to A^T y = c, y ≥ 0.

Maximize \sum x subject to x_i + x_j ≤ Aij, x ≥ 0;
=> Maximize \sum x subject to x_i + x_j ≤ A_ij;
=> Minimize A^T y = \sum A_ij y_ij subject to for all v,
     \sum_{i=v or j=v} y_ij ≥ 1, y_ij ≥ 0
=> possible optimal solution: y_ij = {0, 0.5, 1}
=> y'=2y: \sum_{i=v or j=v} y'_ij = 2, y'_ij = {0, 1, 2}
=> Minimum Bipartite perfect matching/2 (V1=X,V2=X,E=A)

General Graph:
|Max Ind. Set| + |Min Vertex Cover| = |V|
|Max Ind. Edge Set| + |Min Edge Cover| = |V|
Bipartite Graph:
|Max Ind. Set| = |Min Edge Cover|
|Max Ind. Edge Set| = |Min Vertex Cover|

To reconstruct the minimum vertex cover, dfs from each
unmatched vertex on the left side and with unused edges
only. Equivalently, dfs from source with unused edges
only and without visiting sink. Then, a vertex is
chosen iff. it is on the left side and without visited
or on the right side and visited through dfs.

Minimum Weighted Bipartite Edge Cover:
Construct new bipartite graph with n+m vertices on each
    side:
for each vertex u, duplicate a vertex u' on the other
    side
for each edge (u,v,w), add edges (u,v,w) and (v',u',w)
for each vertex u, add edge (u,u',2w) where w is min
    edge connects to u
then the answer is the minimum perfect matching of the
    new graph (KM)

Maximum density subgraph ( \sum{W_e}+ \sum{W_v} ) / |V|
Binary search on answer:
For a fixed D, construct a Max flow model as follow:
Let S be Sum of all weight( or inf)
1. from source to each node with cap = S
2. For each (u,v,w) in E, (u->v,cap=w), (v->u,cap=w)
3. For each node v, from v to sink with cap = S + 2 * D
    - deg[v] - 2 * (W of v)
where deg[v] = \sum weight of edge associated with v
If maxflow < S * |V|, D is an answer.

Requiring subgraph: all vertex can be reached from
    source with
edge whose cap > 0.

Maximum closed subgraph
1. connect source with positive weighted vertex(capacity
    =weight)
2. connect sink with negitive weighted vertex(capacity=-
    weight)
3. make capacity of the original edges = inf
4. ans = sum(positive weighted vertex weight) - (max
    flow)

```
Manhattan MST
For each point, consider the points that surround it(8
    octants). Then, connect it with the closest point.
    For example, consider 45~90. For each point p, the
    closest point is min{x+y | x-y >= p.x-p.y, x >= p.x
    }. Finally, the answer is this new graphs(E=4N) MST.
