2.10 Flow Method

Maximize $c^T x$ subject to $Ax \leq b$, $x \geq 0$;

with the corresponding symmetric dual problem,
Minimize $b^T y$ subject to $A^T y \geq c$, $y \geq 0$.

Maximize $c^T x$ subject to $Ax \leq b$;
with the corresponding asymmetric dual problem,
Minimize $b^T y$ subject to $A^T y = c$, $y \geq 0$.

Maximize $\sum x$ subject to $x_i + x_j \leq A_{ij}$, $x \geq 0$;
 \Rightarrow Maximize $\sum x$ subject to $x_i + x_j \leq A_{ij}$;
 \Rightarrow Minimize $A^T y = \sum A_{ij} y_{ij}$ subject to for all v ,
 $\sum_{i=v \text{ or } j=v} y_{ij} = 1$, $y_{ij} \geq 0$
 \Rightarrow possible optimal solution: $y_{ij} = \{0, 0.5, 1\}$
 $\Rightarrow y' = 2y$: $\sum_{i=v \text{ or } j=v} y'_{ij} = 2$, $y'_{ij} = \{0, 1, 2\}$
 \Rightarrow Minimum Bipartite perfect matching/2 ($V1=X, V2=X, E=A$)

General Graph:

$|Max \text{ Ind. Set}| + |Min \text{ Vertex Cover}| = |V|$
 $|Max \text{ Ind. Edge Set}| + |Min \text{ Edge Cover}| = |V|$

Bipartite Graph:

$|Max \text{ Ind. Set}| = |Min \text{ Edge Cover}|$
 $|Max \text{ Ind. Edge Set}| = |Min \text{ Vertex Cover}|$

To reconstruct the minimum vertex cover, dfs from each unmatched vertex on the left side and with unused edges only. Equivalently, dfs from source with unused edges only and without visiting sink. Then, a vertex is chosen iff. it is on the left side and without visited or on the right side and visited through dfs.

Minimum Weighted Bipartite Edge Cover:

Construct new bipartite graph with $n+m$ vertices on each side:

for each vertex u , duplicate a vertex u' on the other side
for each edge (u, v, w) , add edges (u, v, w) and (v', u', w)
for each vertex u , add edge $(u, u', 2w)$ where w is min edge connects to u
then the answer is the minimum perfect matching of the new graph (KM)

Maximum density subgraph ($\sum W_e + \sum W_v$) / $|V|$
Binary search on answer:

For a fixed D , construct a Max flow model as follow:

Let S be Sum of all weight (or inf)
1. from source to each node with cap = S
2. For each (u, v, w) in E , $(u \rightarrow v, \text{cap}=w)$, $(v \rightarrow u, \text{cap}=w)$
3. For each node v , from v to sink with cap = $S + 2 * D - \text{deg}[v]$
where $\text{deg}[v] = \sum \text{weight of edge associated with } v$
If $\text{maxflow} < S * |V|$, D is an answer.

Requiring subgraph: all vertex can be reached from source with edge whose cap > 0.

Maximum closed subgraph

1. connect source with positive weighted vertex (capacity = weight)
2. connect sink with negative weighted vertex (capacity = -weight)
3. make capacity of the original edges = inf
4. ans = sum(positive weighted vertex weight) - (max flow)

Minimum Path Cover of DAG

1. For each vertex v , split it to v_{in} and v_{out} .
2. For each edge $(u \rightarrow v)$, add an edge between u_{out} and v_{in}
3. $|Minimum \text{ Path Cover}| = |V| - |Maximum \text{ Matching}|$ of the new bipartite graph

5.20 Graph Method

Manhattan MST

For each point, consider the points that surround it(8 octants). Then, connect it with the closest point. For example, consider 45~90. For each point p , the closest point is $\min\{x+y \mid x-y \geq p.x-p.y, x \geq p.x\}$. Finally, the answer is this new graphs($E=4N$) MST.
